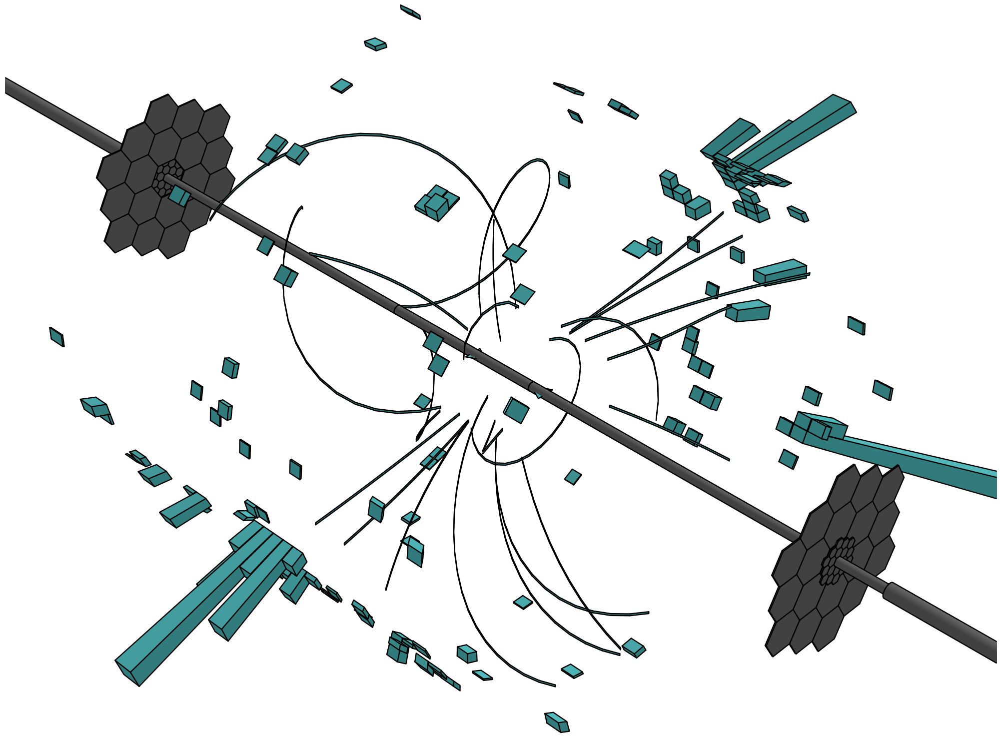
Jets in Heavy Ion Collisions

Strong interaction between high p_T partons and medium → Way to probe QGP's transport properties



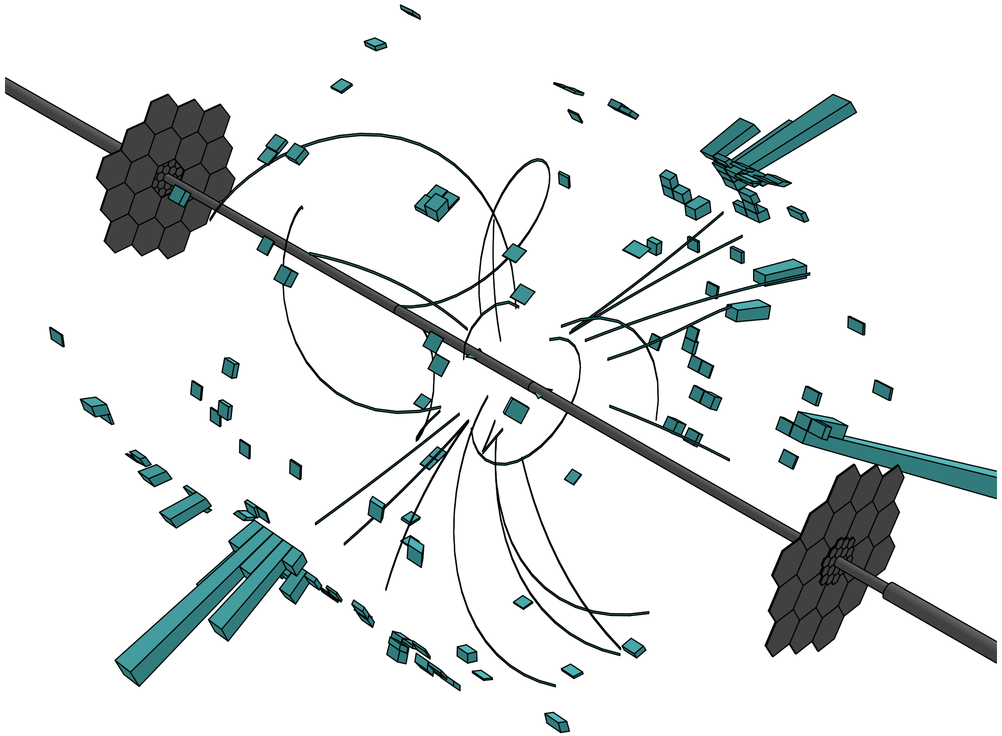
- Jets reconstructed in experiment by a clustering algorithm, commonly anti-k_T [1]
- **Loss of parton energy** in the QGP medium
- **Parton shower broadened** due to medium-induced radiation and scattering

1. Phys. Lett. B 641 (2006) 57-61

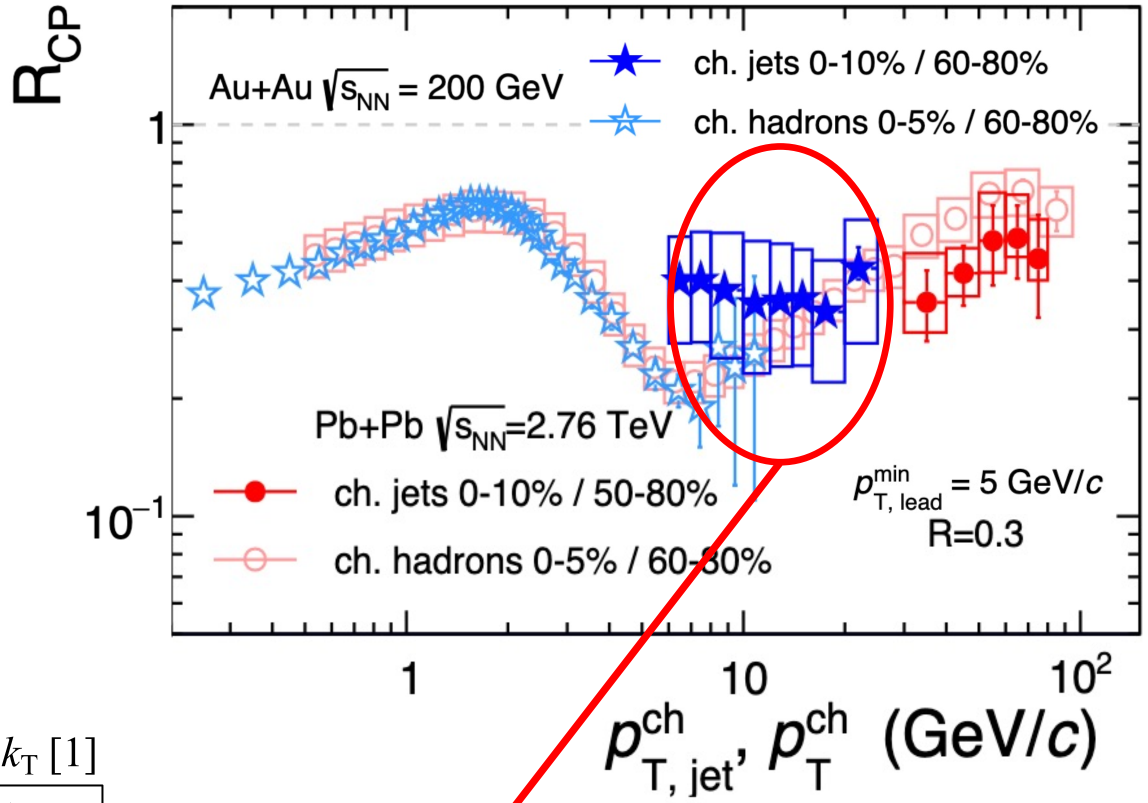
STAR

Jets in Heavy Ion Collisions

Strong interaction between high p_T partons and medium → Way to probe QGP's transport properties



STAR, Phys.Rev.C 102 (2020) 5, 054913



- Jets reconstructed in experiment by a clustering algorithm, commonly anti-k_T [1]

1. Phys. Lett. B 641 (2006) 57-61

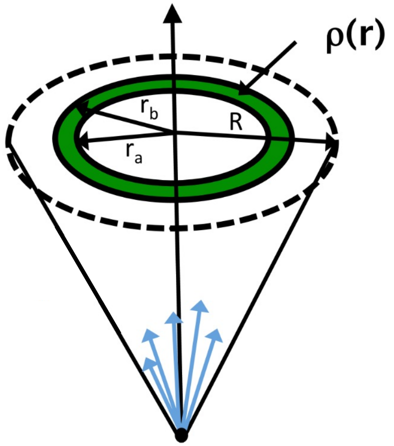
- **Loss of parton energy** in the QGP medium
- **Parton shower broadened** due to medium-induced radiation and scattering

Inclusive jets are heavily quenched in the presence of QGP

Previous Jet Shape Results

$$\boxed{\rho(r) = \frac{1}{\Delta r}\frac{1}{N_{\mathrm{jet}}}\sum_{\mathrm{jet}}\frac{\sum_{\mathrm{track}\in(r_a,r_b)} p_{\mathrm{T,track}}}{p_{\mathrm{T,jet}}}}$$

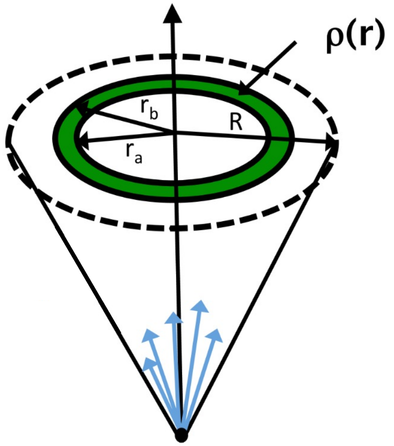
$$r = \sqrt{(\eta_{\mathrm{track}} - \eta_{\mathrm{jet}})^2 + (\phi_{\mathrm{track}} - \phi_{\mathrm{jet}})^2}$$

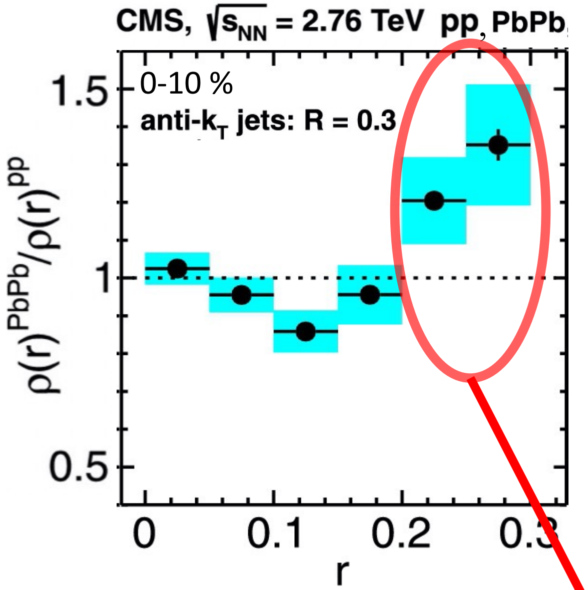


Previous Jet Shape Results

$$\rho(r) = \frac{1}{\Delta r}\frac{1}{N_{\rm jet}}\sum_{\rm jet}\frac{\sum_{{\rm track}\in(r_a,r_b)} p_{\rm T,track}}{p_{\rm T,jet}}$$

$$r = \sqrt{(\eta_{\rm track}-\eta_{\rm jet})^2+(\phi_{\rm track}-\phi_{\rm jet})^2}$$





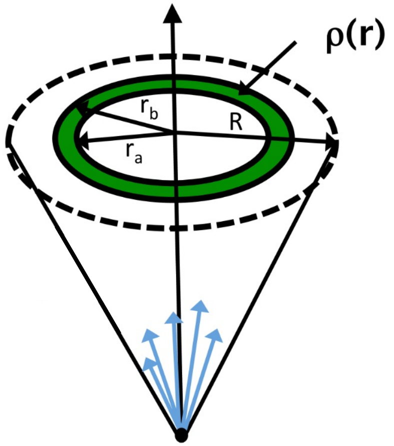
CMS, Phys. Lett. B 730 (2014) 243

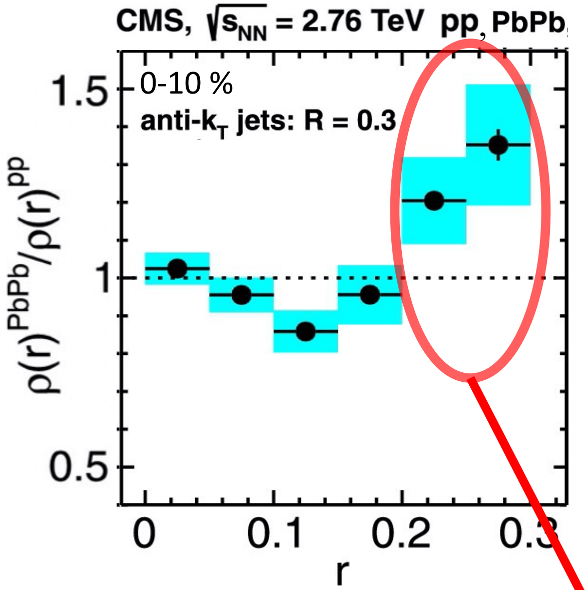
Jet energy is redistributed to large distances from the jet axis in the presence of QGP.

Previous Jet Shape Results

$$\rho(r) = \frac{1}{\Delta r}\frac{1}{N_{\rm jet}}\sum_{\rm jet}\frac{\sum_{{\rm track}\in(r_a,r_b)} p_{\rm T,track}}{p_{\rm T,jet}}$$

$$r = \sqrt{(\eta_{\rm track}-\eta_{\rm jet})^2 + (\phi_{\rm track}-\phi_{\rm jet})^2}$$





CMS, Phys. Lett. B 730 (2014) 243

Possible mechanisms:

- Multiple-scattering
- Medium-induced Bremsstrahlung
- Medium response

Dependent on the mass of the underlying parton

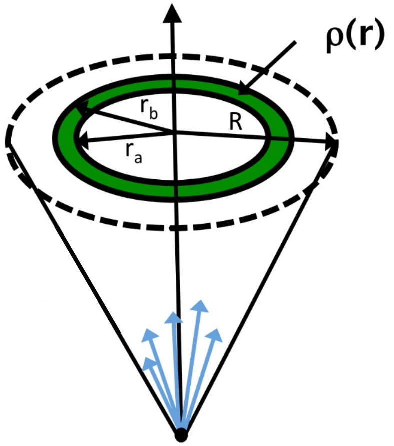
Motivation to look at heavy-flavor jets

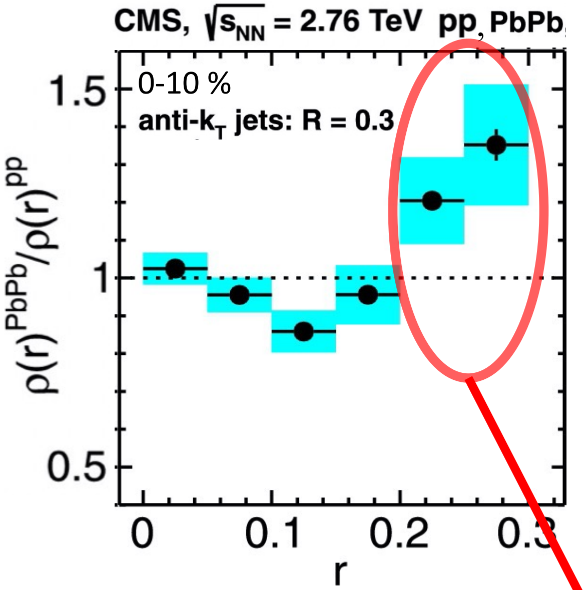
Jet energy is redistributed to large distances from the jet axis in the presence of QGP.

Previous Jet Shape Results

$$\rho(r) = \frac{1}{\Delta r}\frac{1}{N_{\text{jet}}}\sum_{\text{jet}}\frac{\sum_{\text{track}\in(r_a,r_b)} p_{\text{T,track}}}{p_{\text{T,jet}}}$$

$$r = \sqrt{(\eta_{\text{track}}-\eta_{\text{jet}})^2 + (\phi_{\text{track}}-\phi_{\text{jet}})^2}$$





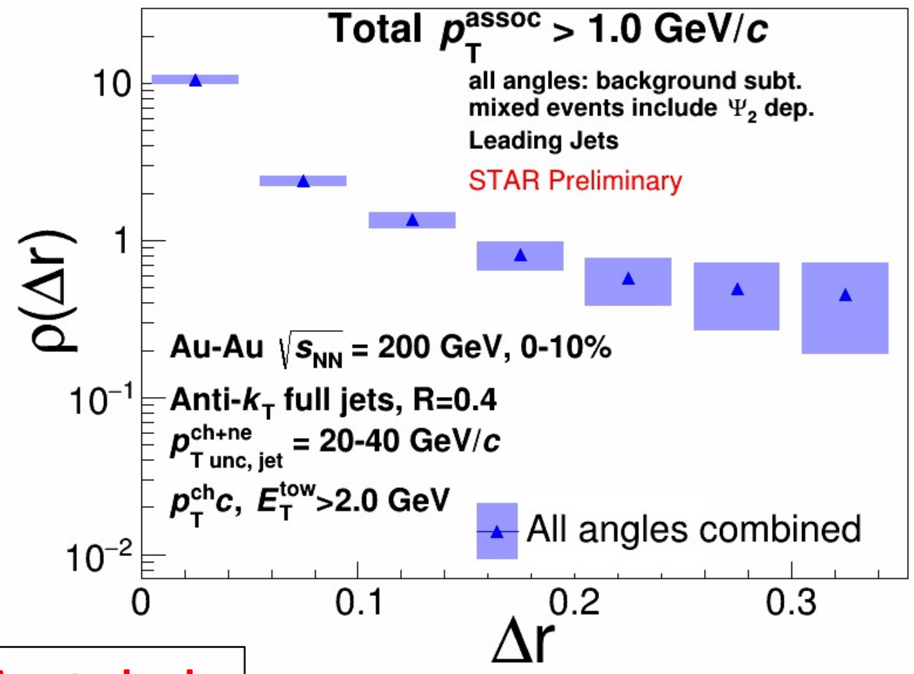
CMS, Phys. Lett. B 730 (2014) 243

Possible mechanisms:

- Multiple-scattering
- Medium-induced Bremsstrahlung
- Medium response

Dependent on the mass of the underlying parton

Motivation to look at heavy-flavor jets

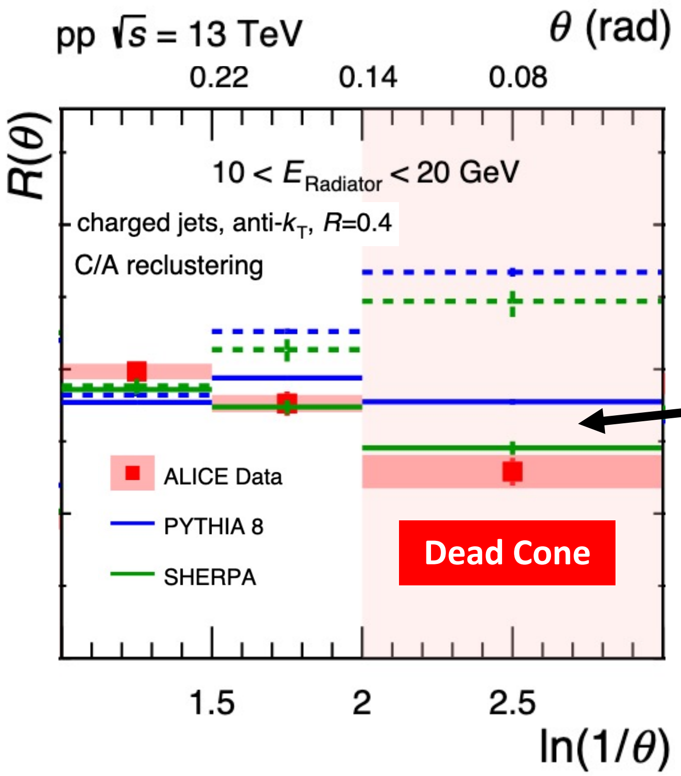


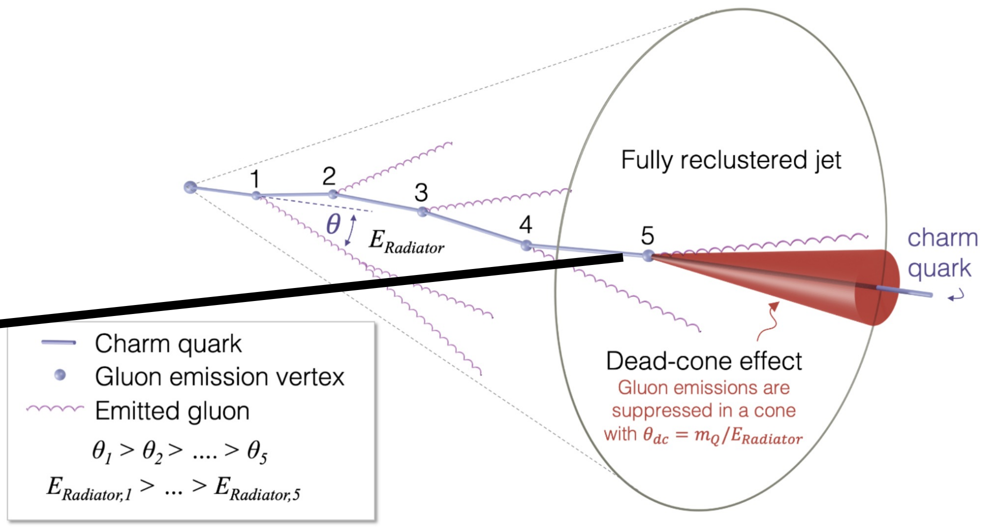
Jet energy is redistributed to large distances from the jet axis in the presence of QGP.

Jets from Heavy Flavor

$$R(\theta) = \frac{1}{N^{\mathrm{D^0\,jets}}}\frac{\mathrm{d}n^{\mathrm{D^0\,jets}}}{\mathrm{d}\ln(1/\theta)} \Bigg/ \frac{1}{N^{\mathrm{inclusive\,jets}}}\frac{\mathrm{d}n^{\mathrm{inclusive\,jets}}}{\mathrm{d}\ln(1/\theta)}$$

ALICE, arXiv:2106.05713 (2021)

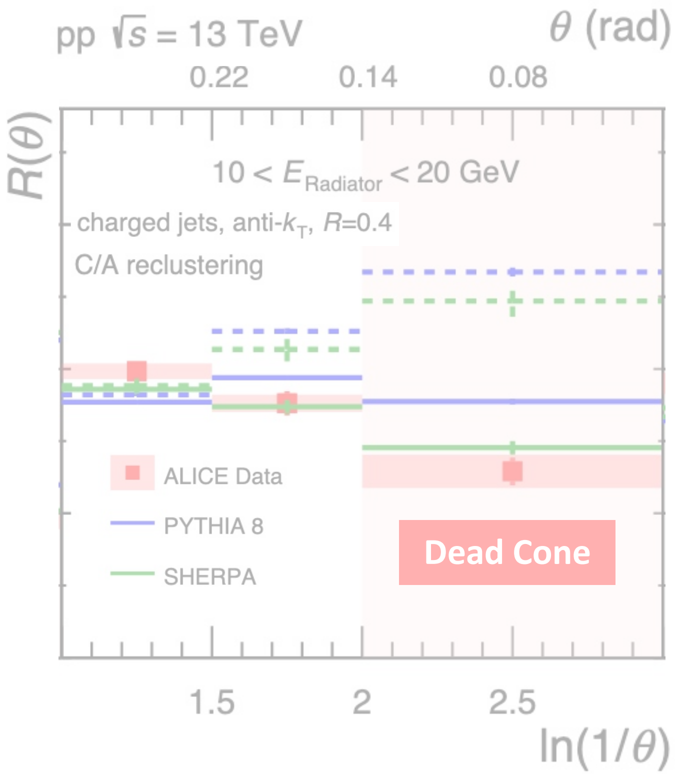




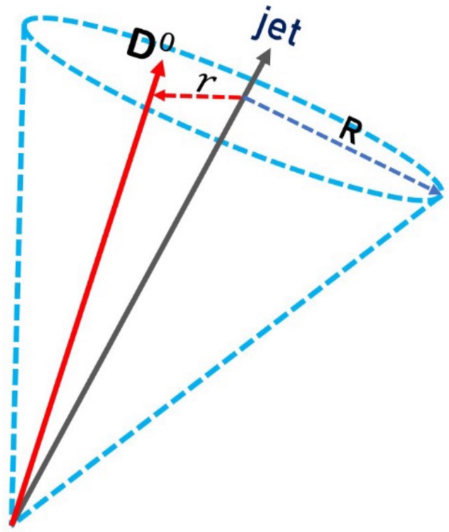
Heavy-flavor emission spectra modified due to dead-cone in vacuum

Jets from Heavy Flavor

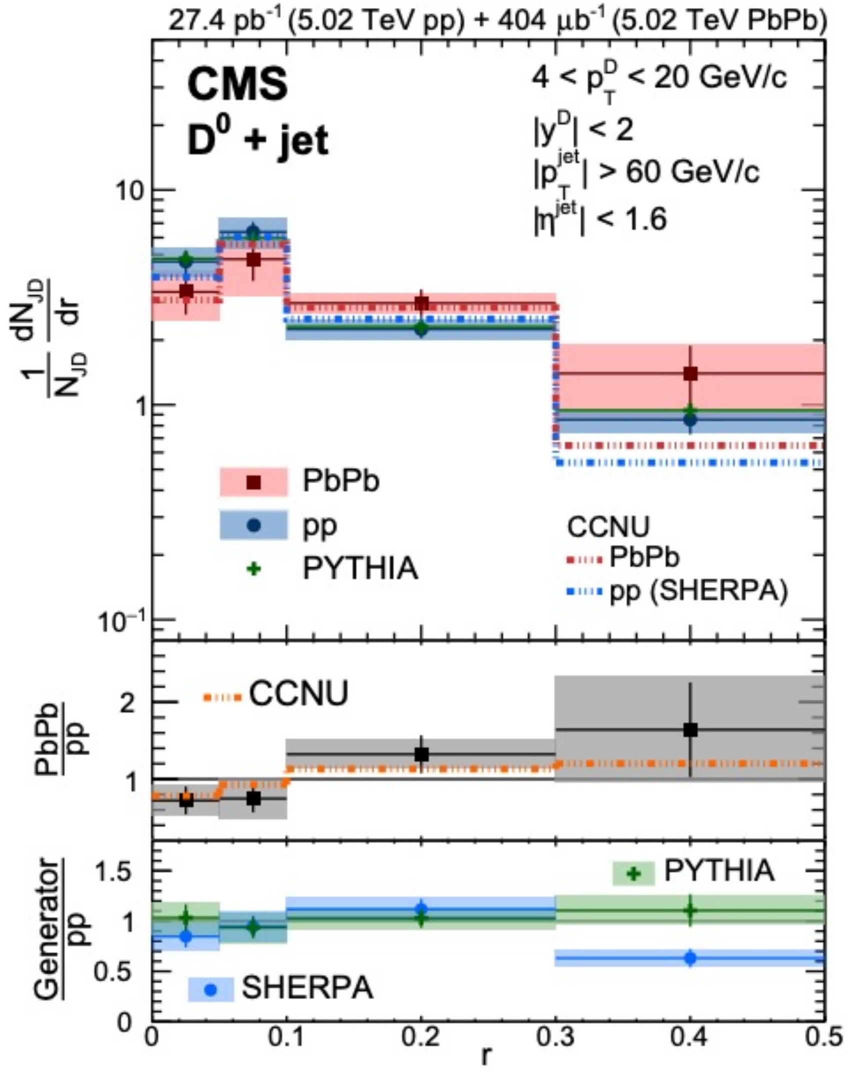
CMS, Phys. Rev. Lett. 125 (2020) 102001



Heavy-flavor emission spectra modified due to dead-cone in vacuum



Low p_T D^0 mesons diffused in the presence of QGP



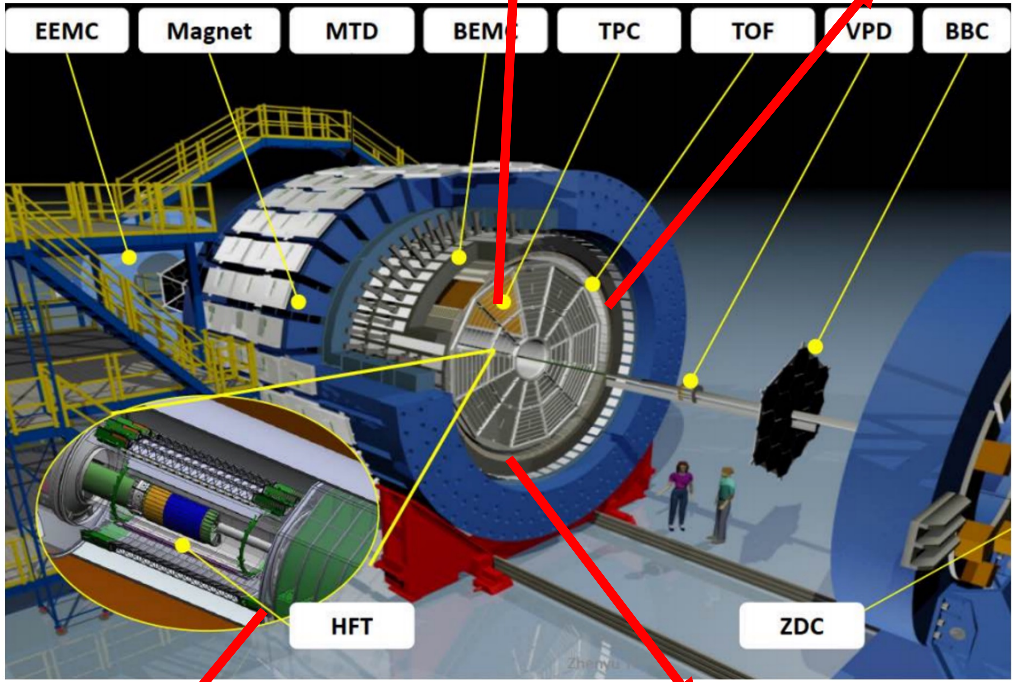
At RHIC energies, stronger modification expected as energy is closer to charm quark mass

STAR

STAR Detector & Selection Criteria

Time Projection Chamber (TPC)
- Measures momentum, track trajectory, and identifies charged particles

Time-of-Flight Detector (TOF)
- Identifies charged particles



Barrel Electromagnetic Calorimeter (BEMC)
- Measures neutral component of energy in jets

Heavy Flavor Tracker (HFT)
- Improves position resolution for tracks

Event Selection :

- Au+Au $\sqrt{s_{NN}}$ = 200 GeV, Run14
- Minimum bias (MB)
- Centrality ∈ [0, 80]% (3 bins: [0-10], [10-40], [40-80])

Constituent Selection :

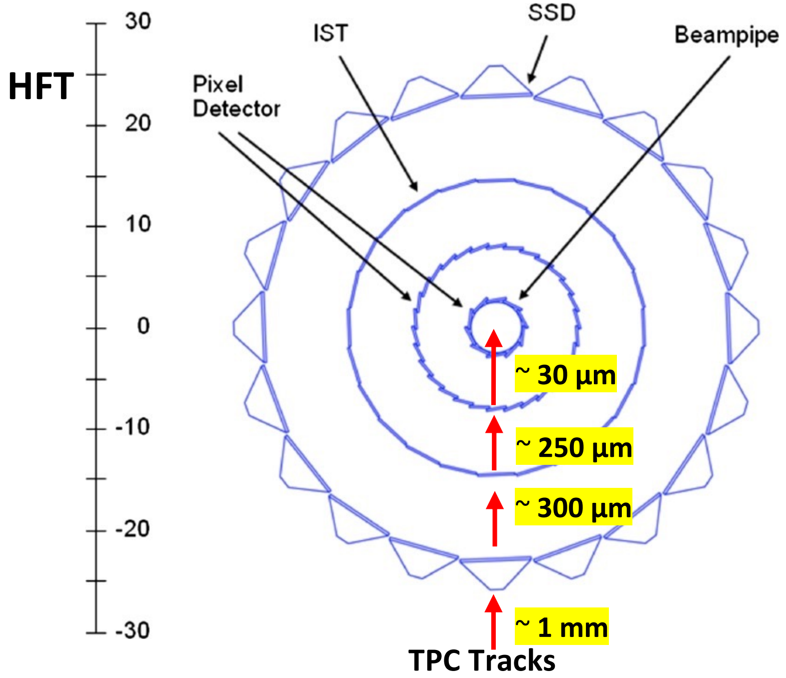
- $0.2 < p_{T,track}$ [GeV/c] < 30 ; $0.2 < p_{T,tower}$ [GeV/c] < 30
- $|\eta_{track}| < 1$; $|\eta_{tower}| < 1$
- $D^0 \rightarrow K^{\mp} + \pi^{\pm}$ [B.R. = 3.82 %]
- For D^0 reconstruction: Tracks need at least two hits in HFT
- $5 < p_{T,D^0}$ [GeV/c] < 10

D^0 Jet Selection :

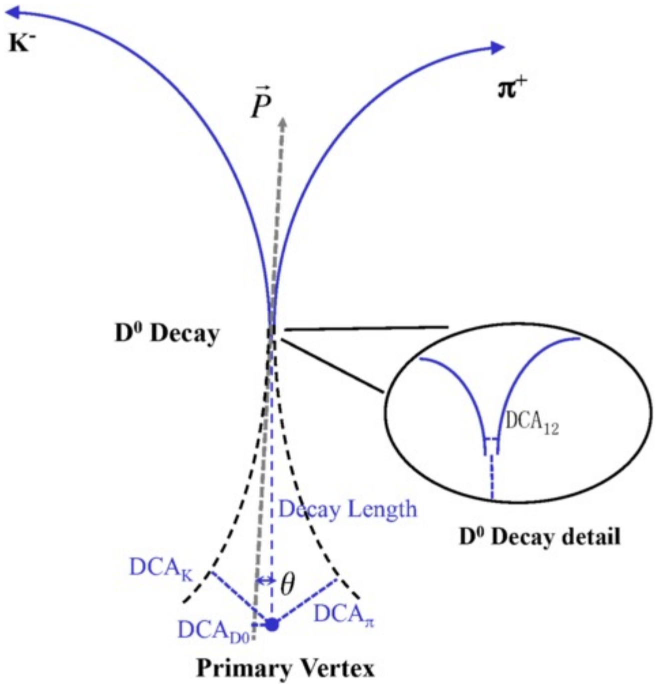
- Anti-k_T full-jets of radius R = 0.4, area-based background subtraction
- $|\eta_{Jet}| < 0.6$

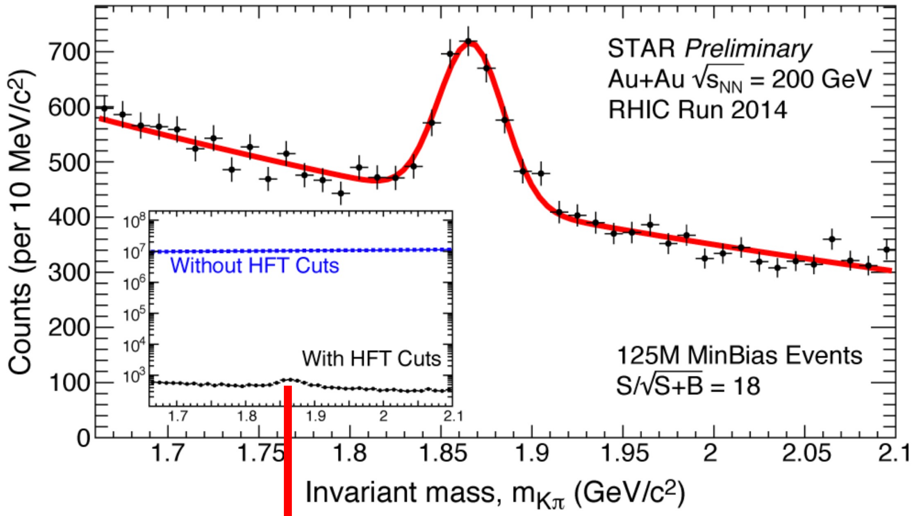
D^0 Reconstruction

- Kaon and Pions identified with hybrid PID from TPC and TOF



STAR, Phys. Rev. C 102 (2020) 014905





Topological cuts on the D^0 candidates improve signal significance

- Decay Length of D^0 ~ 123 µm.
- HFT has a resolution of 30 µm for kaons at ~ 1.2 GeV/c
- HFT can reconstruct D^0 candidates based on the decay kinematics

D⁰ -Jet Yield Extraction

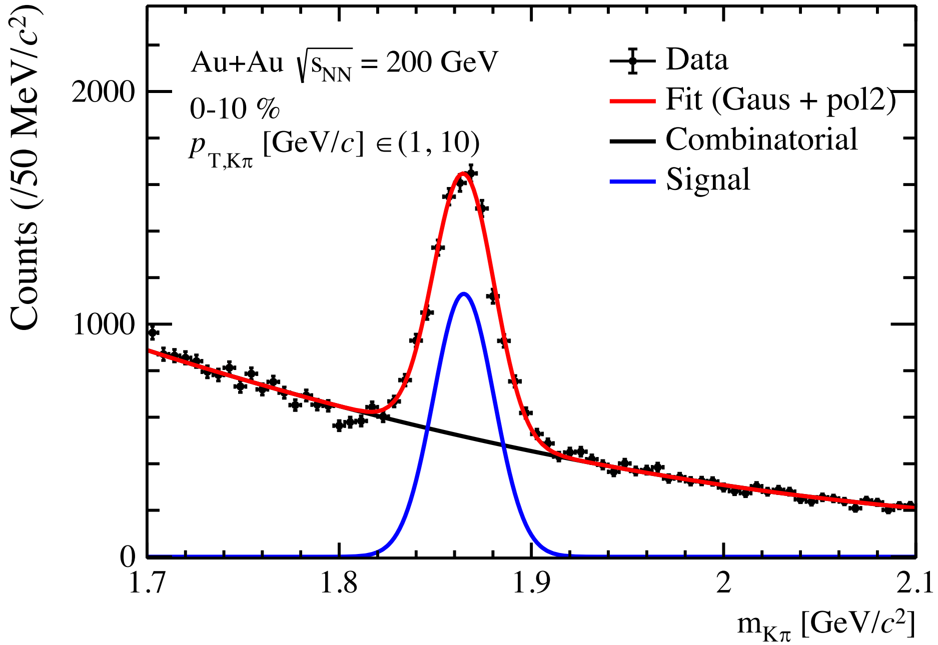
sPlot Method doi.org/10.1016/j.nima.2005.08.106

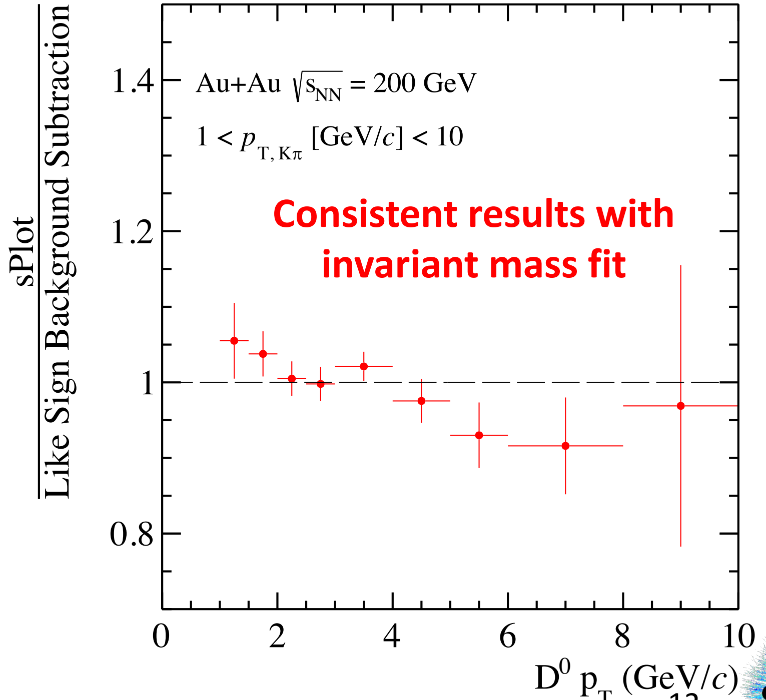
- Native class in RooStats + widely used in HEP
- Unbinned maximum likelihood fit to invariant mass integrated over all kinematics
- $p_{\mathrm{T,Jet}}$ and ΔR histograms with all D^0-jet candidates using sWeights
- Trivial to include reconstruction efficiencies versus D^0 kinematics

sWeights → $${}_s\mathcal{P}_n(m_{K\pi,i}) = \frac{\sum_{j=1}^{N_T} V_{nj} f_j(m_{K\pi,i})}{\sum_{k=1}^{N_T} N_k f_k(m_{K\pi,i})}$$

Unbinned max. likelihood fit
n = n-th fit component(sig/bkg)
N_k = k-th yield (T=2)
$f_k(m_{K\pi,i})$ = per-event PDF value with k^{th} hypothesis
V = cov. matrix

Efficiency Correction in sWeights → $${}_s\mathcal{P}_n(m_{K\pi,i}) \rightarrow \frac{{}_s\mathcal{P}_n(m_{K\pi,i})}{\varepsilon(m_{K\pi,i})}$$





For more information about sPlot, visit poster by Matthew Kelsey [T11_2, #367].

Correction to the Jet Reconstruction

1. Response Matrix for p+p $\sqrt{s}$ = 200 GeV from PYTHIA and GEANT3 to get the detector response
2. Single Particle Embedding in heavy ion event to model fluctuations in area-based background subtraction
3. Reweight PYTHIA with a prior (FONLL c-quark) to match the shape of the jet p_T spectra
4. Heavy-flavor jet fragmentation modeled from PYTHIA
5. Systematics from variation in fragmentation model will be studied later

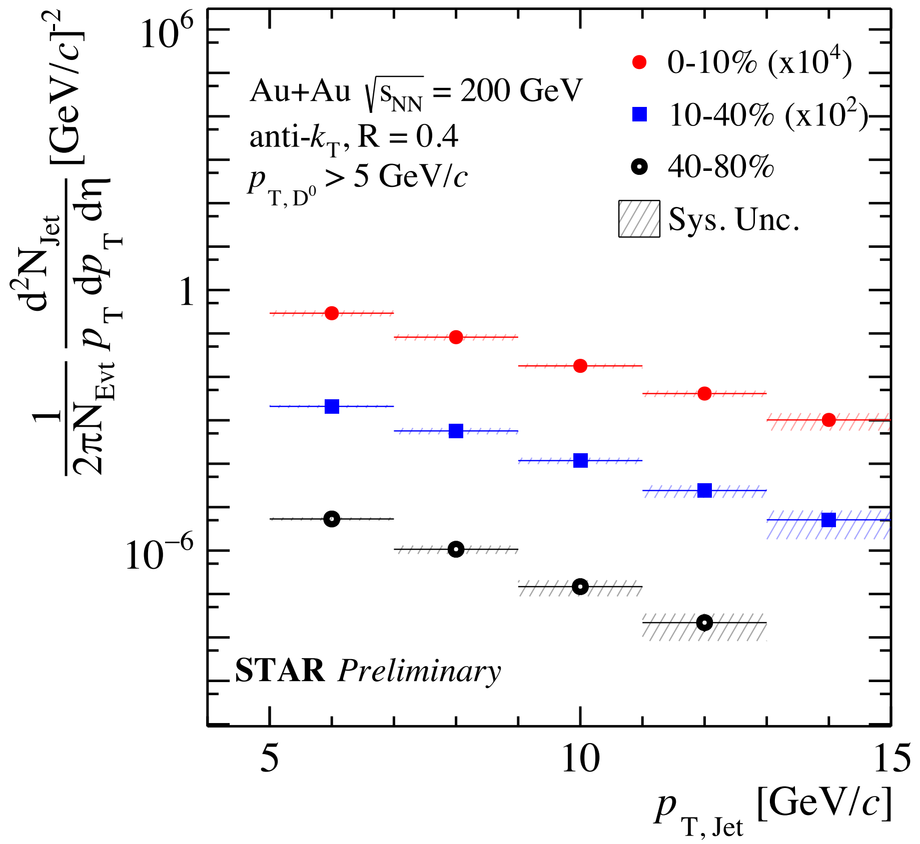
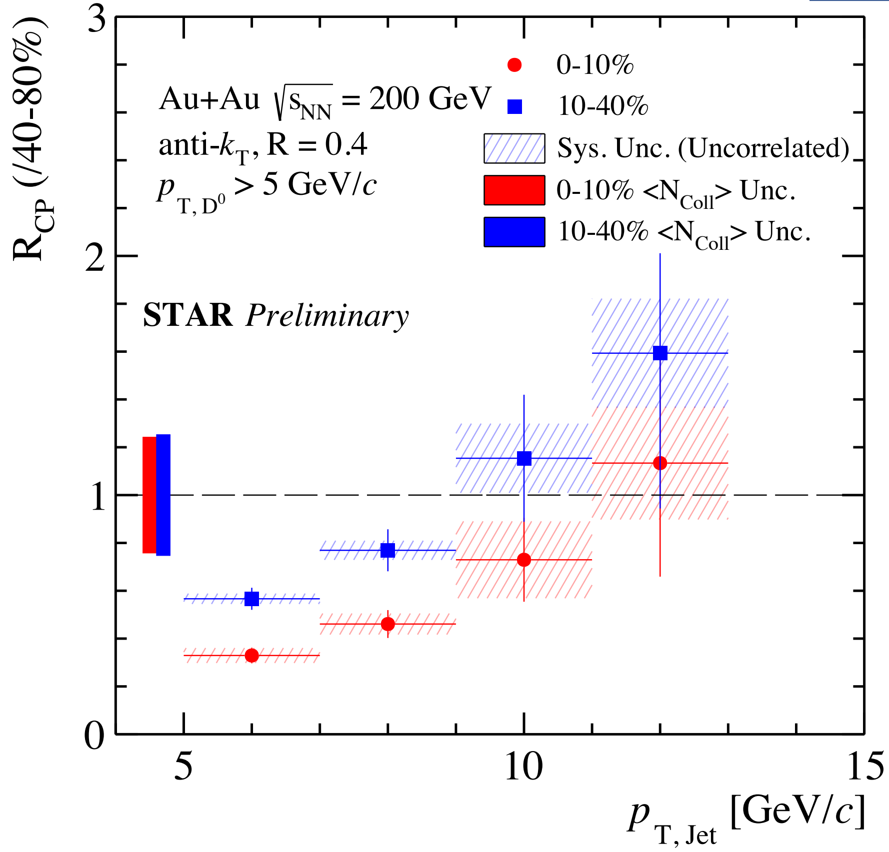
Final Response Matrix to unfold $p_{T,Jet}$

***Response Matrix for ΔR in backup**

Jet Spectra

New For QM22

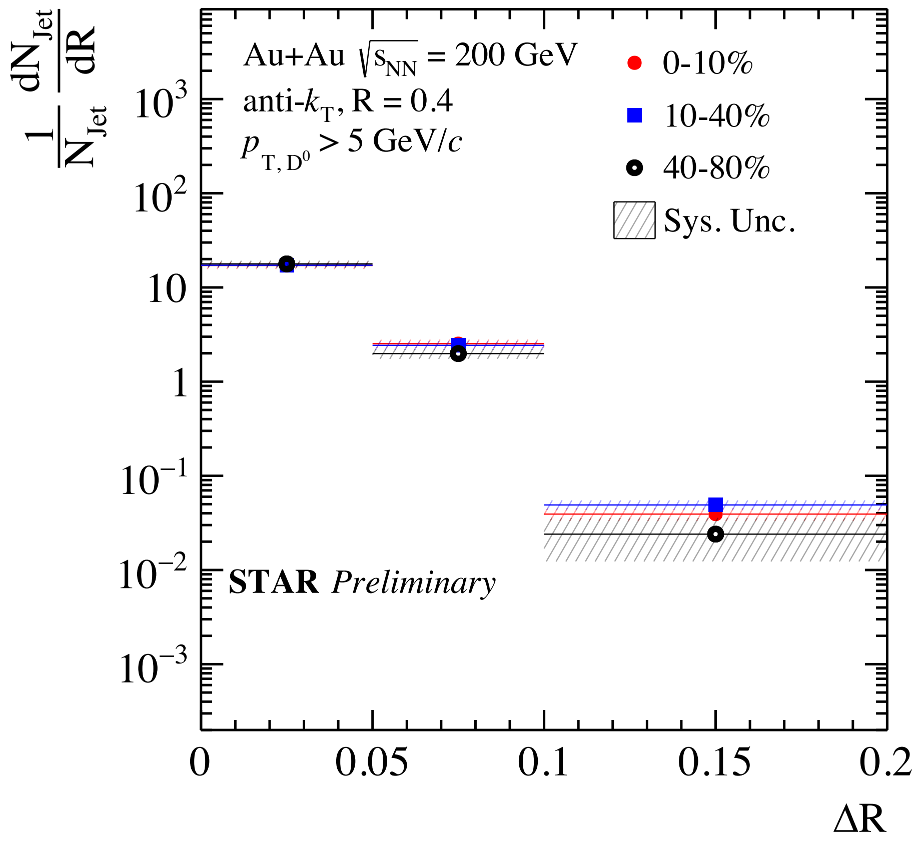


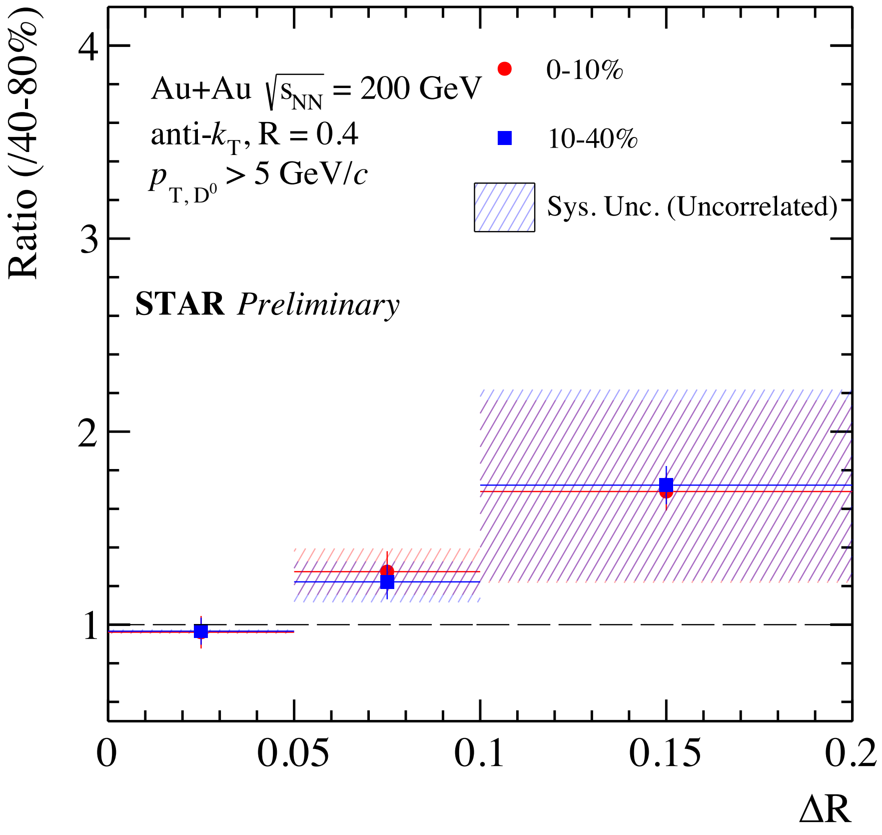


- Central spectra is more suppressed than mid-central.
- R_{CP} for both central and mid-central show interesting p_T dependence
- Peripheral has limited statistics with the D^0 p_T cut. R_{CP} is severely limited by peripheral statistics.
- p+p baseline for R_{AA} calculation at STAR would be beneficial

Radial Distribution of D^0 Mesons in Jets

New For QM22



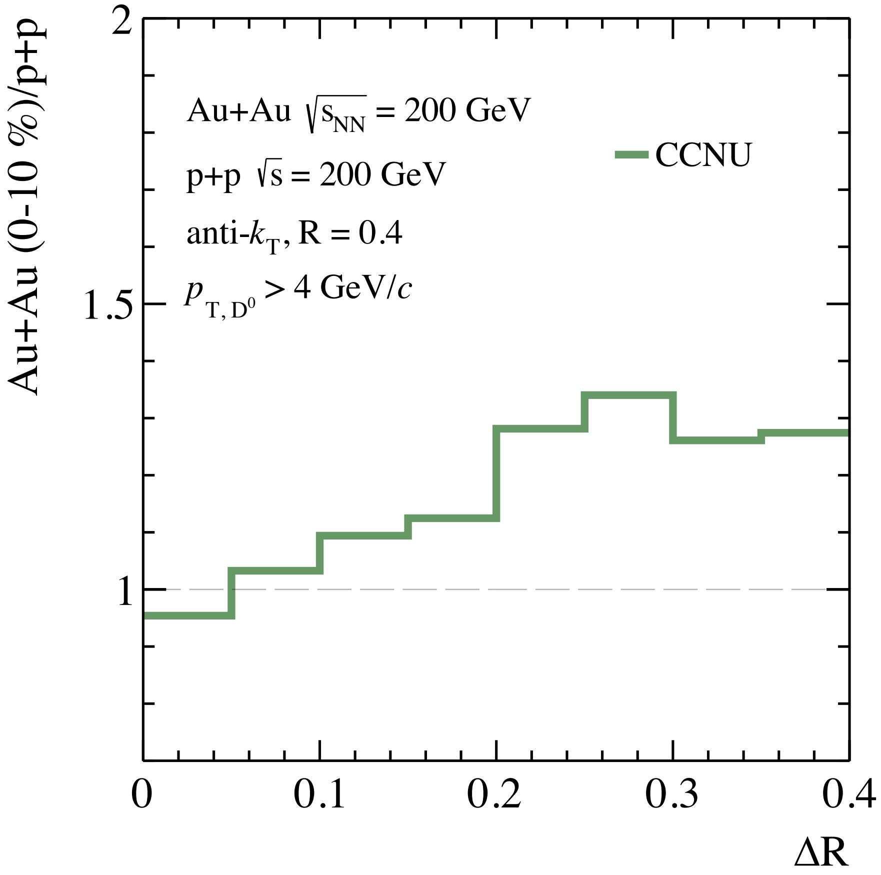


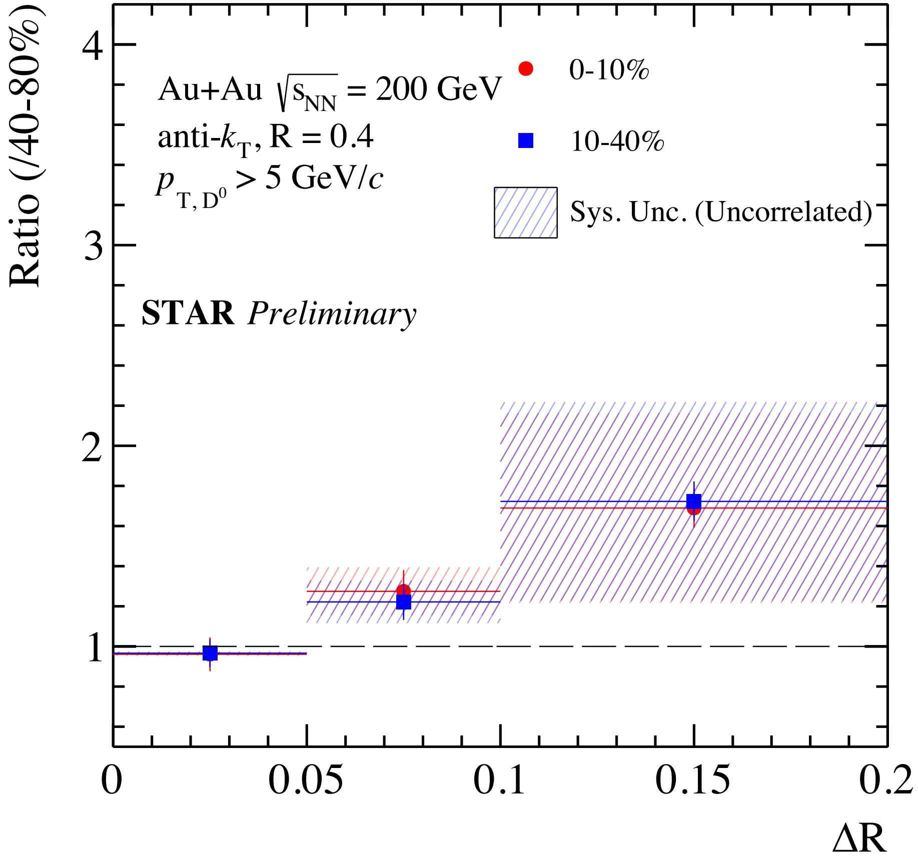
- Small hint of diffusion in the presence of QGP at RHIC energies

Ratio of Radial Distributions

New For QM22

Eur. Phys. J. C79 (2019) 789

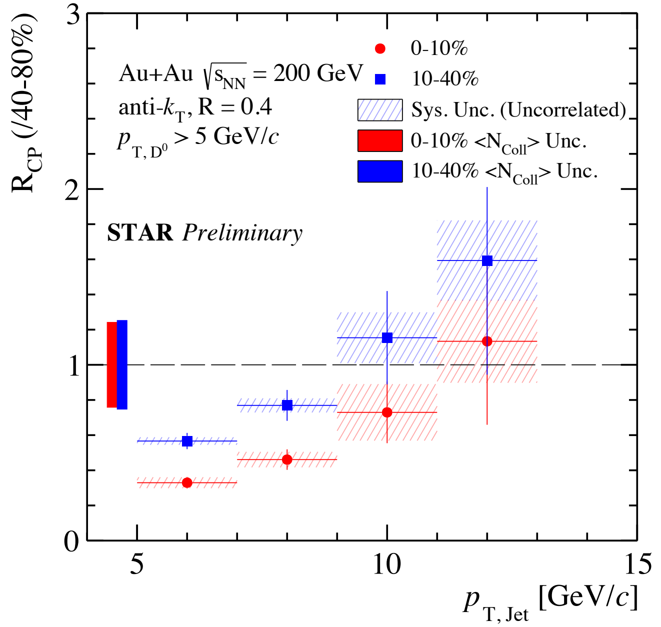


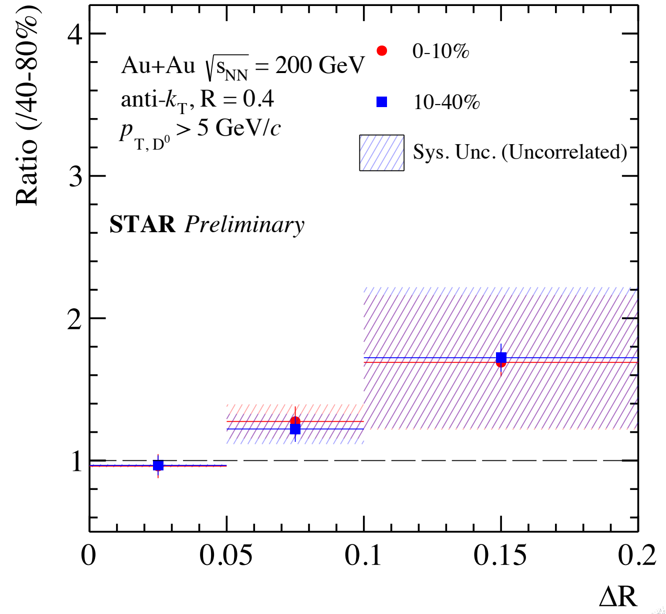


- Qualitatively, similar to the predictions from CCNU for R_{AA}

Summary

- First charm-jet measurement at RHIC energies
- Spectra for D^0-jets in central and mid-central events suppressed with respect to peripheral in the p_T range of 5-10 GeV/c
- R_{CP} for both central and mid-central show interesting p_T dependence
- Radial distribution of D^0 mesons show hints of diffusion in central and mid-central events with respect to peripheral events





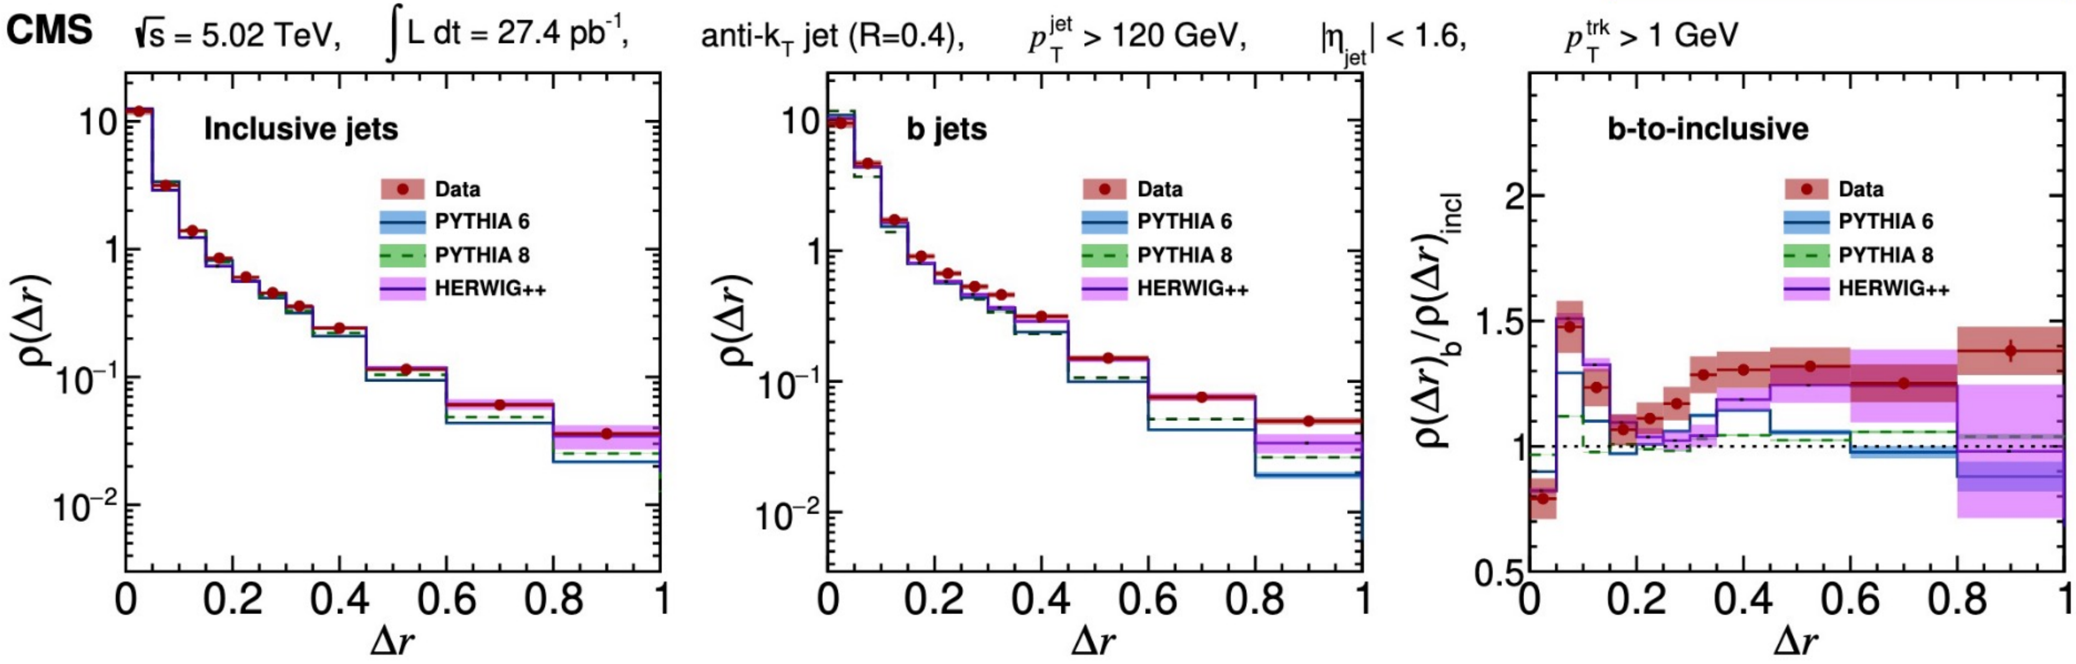
Outlook

- Study the dependence of the observables on the fragmentation function of heavy quarks in simulation
- Explore low D^0 p_T ranges to extend kinematic acceptance

Backup

Differential jet shape for heavy quark in vacuum

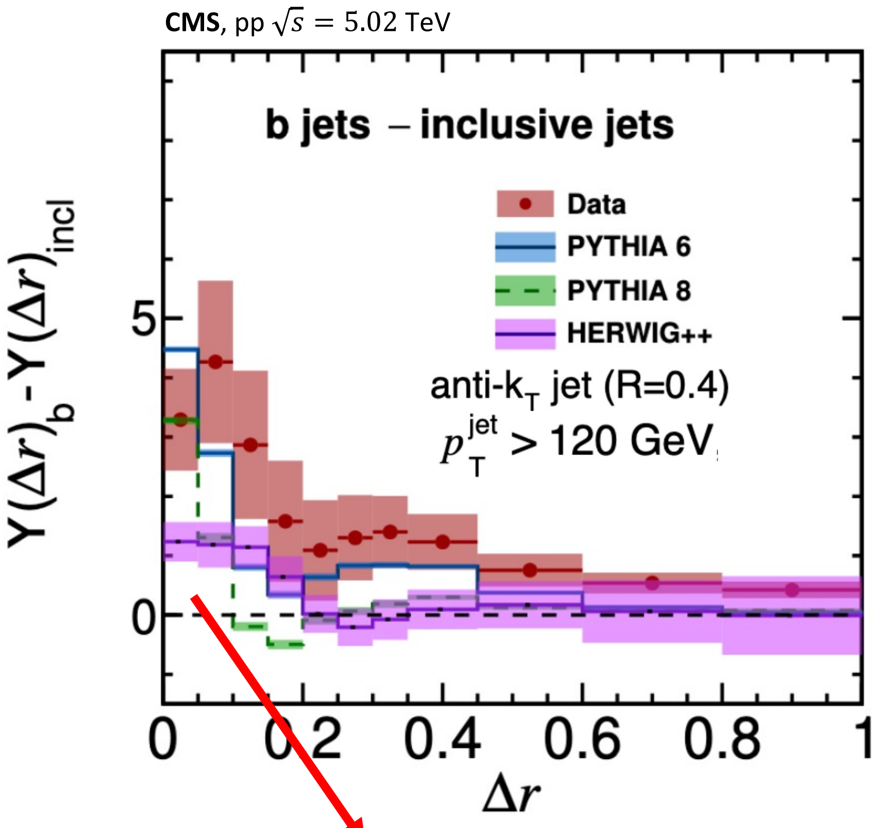
CMS, JHEP05 (2021) 054



Bottom quark jet (b-jets) shapes modified in vacuum, possibly due to dead cone

Fragmentation pattern for heavy quark

CMS, JHEP05 (2021) 054



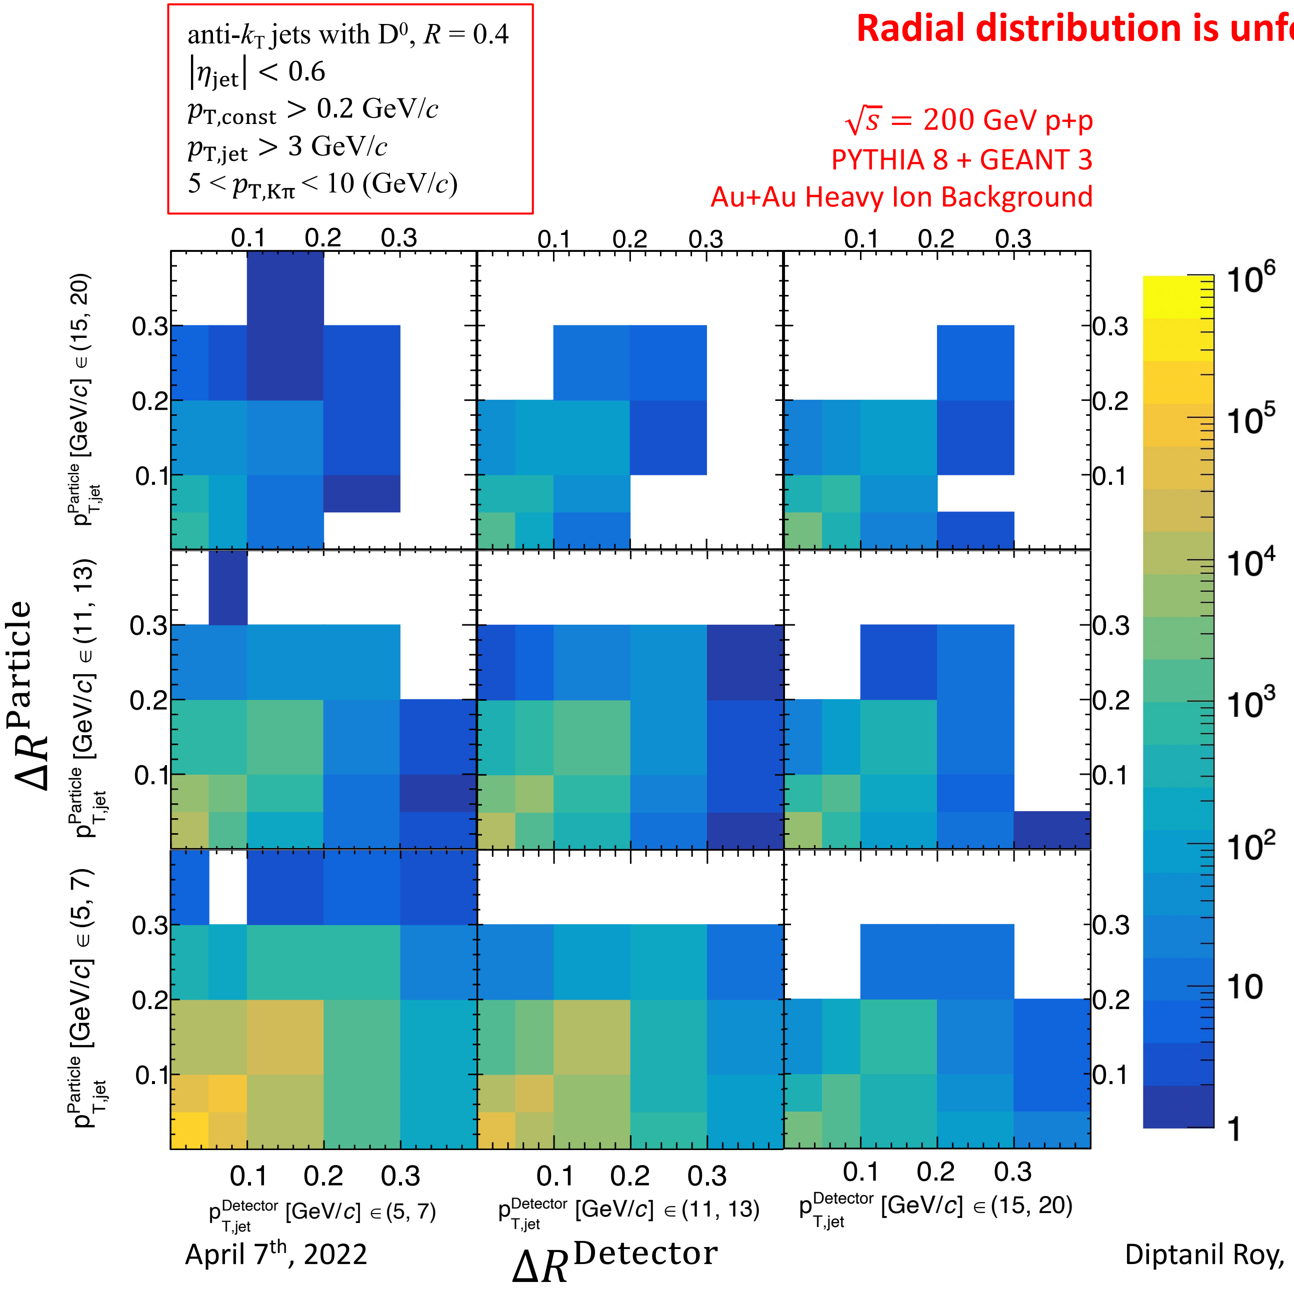
$$Y(\Delta r) = \frac{1}{N_{\mathrm{jets}}} \frac{\mathrm{d}^2 N_{\mathrm{trk}}}{\mathrm{d}\Delta r \mathrm{d}p_{\mathrm{T}}^{\mathrm{trk}}}$$

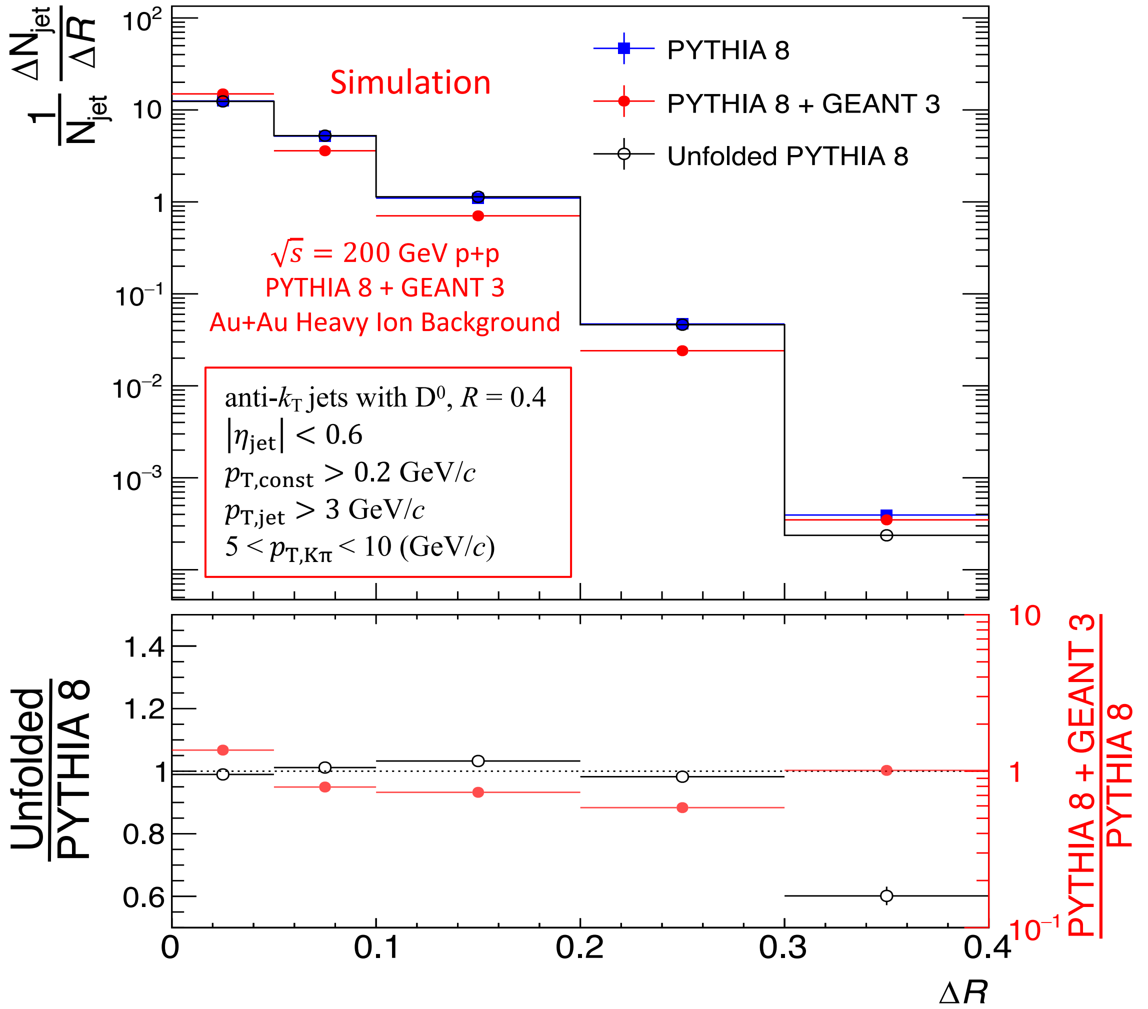
Higher yields of low p_T charged-particle close to jet axis in b-Jets vs inclusive jets in vacuum

~ Different fragmentation pattern for heavy quarks

Unfolding To Correct For Radial Distribution of D^0 Mesons in Jets

Radial distribution is unfolded along with the $p_{T,jet}$





- Closure test shows that we can reproduce the radial distribution of D^0 mesons for low and mid ΔR using 2D unfolding
- The closure for the last bin can be improved by increasing the simulation statistics
